

1 · Forward model

displayed hue $\rightarrow$ hue perceived by CVD

$$\delta\theta = \beta_s \cos(\theta - 90^\circ) + \beta_c \cos(\theta - \theta_{\text{conf}})$$

2 · Candidate loss atoms

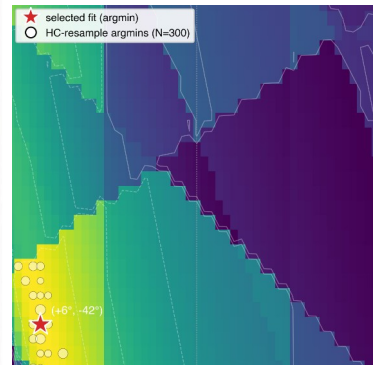

1 · Separation

2 · Boundary saturation

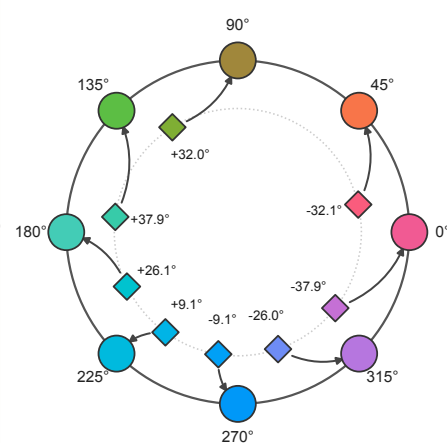

3 · Held-out test loss

3 · Grid search

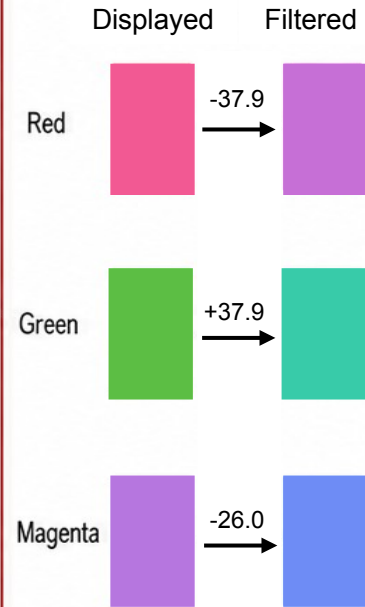

argmin over (β_s, β_c)
in $[-90, 90]^2$, 2° grid

4 · Pre-image inversion

$$\text{solve } \theta_{\text{pre}} + \delta\theta(\theta_{\text{pre}}) = \theta$$

5 · Personalized filter

$$\delta\theta_{\text{filter}}(\theta) = \theta_{\text{pre}} - \theta$$
